

The impact of assisted dying on palliative care

v7

It is often claimed that palliative care can live comfortably with assisted dying

The reality is very different

Hospice closures

In Canada, hospices refusing to offer assisted deaths have had their funding stopped ¹
Assisted deaths are much cheaper than hospice care
(1 Canadian AD = 1 week UK hospice care)

Hospice uses slows

In Oregon, growth in hospice use was slower than elsewhere in the US ²

Funding remains poor

In Canada, only 15% of people have access to publicly funded home PC, ⁶ and less than half of assisted deaths have seen a specialist PC team. ⁹

Hospices say no

- Oregon (in 2012): 66% of hospices did not allow staff to take part in assisted deaths. ³
- New Zealand: nearly all hospices have refused to participate
- Jersey: hospice will not participate. ⁴

Palliative care services stall

- In Belgium and the Netherlands 2012-19 growth stalled in home care, hospital and inpatient palliative care services ⁵
- Growth in European non-AD countries increased faster than AD countries ⁵

Changed doctor-patient relationships

In Canada some doctors found the relationship with patients was more difficult after legalisation ⁷

In Australia doctors are unable to fulfil their legal requirements ⁸
